A: Human built dam below traditional spawning area.
B: Beavers dammed lower portion during low flows, dam was removed but high water made accurate redd counts impossible.
C: Log jam may have been partial barrier.
D: Counts may be low due to incomplete survey.
E: High flows may have obliterated some redds.
F: Ice may have obscured some redds.
G: In some years a basin wide redd count is conducted, in which a longer length of stream is counted.
The count value reported in the main table above is for the normal stream length that is counted each year. At right is a table with the ***totals*** for the basin wide years, including the extra lengths of stream:

Totals for Basin Wide Redd Counts

	1980	1981	1982	1986	1991	1995	2000	2003
Swan:								
Elk Creek						157	219
