Statewide Angling Pressure

Mail Survey

1993

Prepared by:

Robert C. McFarland
Janet E. Hughes

Montana Department of Fish, Wildlife and Parks

October, 1995

INTRODUCTION

The Montana Department of Fish, Wildlife and Parks has conducted statewide angling mail surveys in the past. Bishop (1959, 1960 & 1961) conducted the first recorded mail survey of fishing pressure on a statewide basis for Montana. He found that residents fished 1,323,129 angler days, nonresident season license holders fished 60,632 angler days, and nonresident 6-day permit holders fished 40,933 angler days for the 1958 season. In 1959 residents fished 1,345,000 angler days, nonresident season license holders fished 54,000 angler days, and nonresident 6-day permit holders fished 121,000 angler days. In 1960 the third annual survey was conducted and residents fished 1,356,000 angler days, nonresident season license holders fished 53,000 angler days, and nonresident 7-day permit holders fished 112,000 angler days.

In 1968 the statewide angling pressure mail survey was again initiated by Holton (1970). He found residents had fished 1,519,126 angler days, nonresident season license holders fished 69,653 angler days, and nonresident 6-day permit holders fished 161,772 angler days.

Holton (1971) conducted another statewide survey for the 1969 license year. No results were reported because it was felt they were too high due to sampling problems.

In 1975, Gaffney (unpublished data) conducted a statewide survey of angling pressure by mail. He found residents fished a total of 2,314,030 angler days and nonresidents 508,034 angler days for a statewide total of 2,822,093 angler days. An attempt was made to continue that statewide survey in 1976 using the 1975 mailing lists. This did not provide adequate samples for nonresidents, so only resident pressure was obtained.

Holton (1974) stated,

"The lack of up-to-date fishing pressure information on individual waters has been a handicap in fisheries management. It is recommended that (the) evaluation of (a) mail survey to fill this need be accomplished as soon as feasible."

The surveys were started again in 1982 and run for four consecutive years (McFarland, 1989). The statewide angling pressure ranged from 2,197,402 to 2,723,713 angler days. In 1986 the surveys were again cancelled for lack of funding.

In 1989, the Montana Legislature approved funding for an "Enhanced Survey of Angling Pressure". The funding was such that the survey was to be conducted every other year. In March, 1989, the statewide angling use mail survey was again re-initiated. The statewide angling pressure was estimated at 2,336,085 angler days (McFarland, 1991). In 1991, the statewide use was estimated at 2,300,880 (McFarland & Hughes, 1993).

METHODS

The 1993 statewide angling mail pressure survey began in March of 1993 and was conducted for the license year ending in February, 1994.

Samples were drawn from the Department's Sportsman's Database. There are six types of fishing licenses available to residents: a season license, a combo license, a sportsman's license, a "senior" license, a "youth" license and a disabled license. A season license is required for those resident anglers between the ages of 15 and 61 inclusive (a conservation license is required as a prerequisite to purchasing any fishing license). Residents between the ages of 12 and 14 inclusive, are required to purchase a conservation license to fish. These were determined by using the date of birth on the Conservation license and were classified as "youth" license holders. The combo license combines a season fishing license and a conservation license. A sportsman's license provides a deer "A" tag, elk tag, bear tag, conservation license, a game bird stamp and a fishing license. Residents 62 years of age and older are entitled to fish by purchasing a conservation license. These were determined by using the date of birth on the Conservation license and were classified as "senior" license holders. Residents who are certified as permanently and substantially disabled may purchase a "Disabled Persons Conservation License". The "senior", "youth", and "disabled" licenses were combined for the "SYD" population.

Nonresidents 15 years of age and older must have a valid Montana fishing license to fish. Those nonresidents under the age of 15 may fish by buying a nonresident license or by being in the company of an adult with a valid Montana fishing license. If the latter, the combined limit may not exceed the limit for one adult. Nonresidents have four types of licenses available for fishing in Montana; a combo license, a seasonal license, a two-day permit, and the big game combo. A nonresident conservation license is required as a prerequisite to purchasing any nonresident fishing license. The combo license combines a nonresident conservation license and seasonal fishing license. The big game license includes a conservation license, an elk tag, a deer "A" tag, a black bear tag, a fishing license and an upland game bird license. A two-day permit enables the nonresident angler to fish for two consecutive days of their choice. Anglers may purchase as many two-day permits as they want.

A computer program was written in PASCAL to create three populations of anglers from which to draw samples. A resident population, a nonresident population and a "SYD" population were created each month. The resident population comprised the following license types: combo, season, and sportsman. The nonresident population comprised the following license types: nonresident combo and nonresident season. The "SYD" population consisted of the following license types: senior (62 years of age and older), youth (between 12 and 14 years of age inclusive), and disabled.

Gaffney (1982) sampled the 17,000 nonresident big game license holders in 1980 and found that 29.6% had fished while in Montana. They averaged 3.9 days fishing per person which would account for nearly 20,000 man days of use. This is less than 1% of the total pressure in the state. Due to budgetary constraints and the small amount of pressure, the big game license holders were not included in the nonresident sampling for 1993.

A PASCAL computer program was used to pull a random sample from each population. The amount pulled from each population was

proportionally allocated to the angling pressure each population exerted from previous surveys. This proportion remained constant throughout all sampling periods.

The sample from each population was copied into a dBASE format structure and wave information and sequential serial numbers added. A dBASE computer program was written to affix names and address as well as bar codes directly to each questionnaire. The questionnaire, and a return envelope were stuffed into window envelopes and mailed (see appendix for examples). All questionnaires were mailed bulk rate.

Sampling was done on a stratified basis. Strata (waves) were monthly for the resident, seasonal nonresident, and SYD populations (Table 1).

Nonresident 2-day license holders could not be sampled directly, so nonresident conservation license holders were sampled and questions asked to ascertain if they were valid 2-day permit holders. These questionnaires were sent out the beginning of March since less than 2% (2,084) of the 2-day permits are remitted after this date. The questionnaire asked about their fishing in Montana for the entire license year.

Table 1. - Period of time covered for waves for the 1993 statewide angling survey.

Authorized private dealers sell fishing licenses throughout the state. In addition the seven regional headquarters and the Helena office sell licenses. All licenses are to be remitted to the licensing bureau in Helena by the 10th of the following month of the sale. Each license is a five-part form. The original remains with the angler, the first copy was sent to Bozeman for use in the surveys, the second copy was retained in Helena, the third copy was sent to the area warden and the fourth copy was retained by the license dealer. The licenses usually arrived in Bozeman one week after they were remitted to Helena. Licenses are then keyed and entered into the Sportsman's Database. Samples for the previous month were then pulled and the questionnaires mailed around the 20th of the following month. For example, samples for August would be pulled and sent around the 20th of September.

Past surveys indicated that residents provide approximately 80% of the pressure (Gaffney 1975, McFarland 1989, McFarland 1991), therefore sampling was done on a 80/20 split between residents and nonresidents (i.e. proportional allocation). Actual numbers sent varied slightly

from wave to wave (Table 2). Proportional allocation was used for determining sample sizes from wave to wave. For the "summer" waves 10,000 residents and nonresidents were sampled. In the "winter" the rate dropped to 5,000 residents and nonresidents. Since waves 1 and 2 had fewer license holders from which to sample, these two waves were sampled at a less intense level.

Table 2. - Number of questionnaires sent for each wave by residency for 1993.

99		10000		8670		5234

Two survey questionnaires were used, one for residents and season nonresidents and the other for 2-day nonresidents. The resident/nonresident questionnaire (see appendix A for examples), included questions on: what water was fished; nearest landmark, town, or county; section of stream or river fished (taken from map on back of questionnaire); date fishing occurred; and number of days fished; and whether the fishing was primarily from shore, boat or ice. The 2-day questionnaire was the same basic design but included questions to ascertain if the respondent was a valid 2-day fishing permit holder and how many permits they bought. The survey also asked about their entire year of fishing versus a single month.

To ease the sorting process different colored forms were used for each wave and also for initial and remail mailings.

Remail questionnaires were mailed, to those individuals who had not yet responded, from two to four weeks after the initial mailing. Returns for each wave were monitored and when they slowed down to a few each day the remail was sent. Included in the remail was an explanation, (see appendix A for examples), a duplicate questionnaire and a return envelope. Returns were grouped and counted according to type of license, wave and mailing (initial or remail).

Phone surveys were made to resident anglers and nonresident 2-day license holders who had not responded in either the initial or remail mail survey. The phoning was done for all waves. Data from this survey was used to determine if a nonresponse bias existed and to make adjustments if necessary.

The formula used was:

$$A_{ij} = R_{ij} + \frac{P_{ij}}{M_{ij}} [I - R_{ij}]$$

1

where A_{ij} = Adjustment factor for nonresponse for the ith wave and jth residency

R_{ij} = Response rate for mail survey for ith wave and jth residency (response rate is the total number of returns divided by the total number of surveys mailed out minus the number of nondeliverable surveys)

P_{ij} = Phone rate of days fished per respondent for ith wave and jth residency

M_{ij} = Mail rate of days fished per respondent for ith wave and jth residency

Since no significant difference ($P=.47$, paired t-test=.75, d.f.=11) was found in response rates between mail and phone respondents the adjustment factors were all set to 1.0.

After all questionnaires were received those that had fished in Montana during the period in question were separated from those who said "no". The "yes" respondents were then hand coded and assigned a numeric code for each water fished. They were visually edited for accuracy and completeness.

All data were then keypunched with each day of fishing recorded as a single record. Edits were run to correct invalid water codes. FORTRAN computer programs were written to analyze the data and calculate fishing pressure and standard errors.

Estimates were made for individual waters based upon the formula:

$$P_j = \sum_{i=1}^n \left[\frac{E_{ij} * D_{ij}}{R_{ij}} \right] * A_{ij}$$

where P_j = Pressure for an individual water by the jth residency

E_{ij} = Number of eligible anglers for the ith wave and jth residency

D_{ij} = Days fished that particular water for the ith wave and jth wave

R_{ij} = Number of respondents from the survey for the ith wave and jth residency

A_{ij} = Adjustment factor for nonresponse for the ith wave and jth residency

n = number of waves in the estimate year or season

j = number of residency types (resident, nonresident, or total)

The variance was then calculated using:

$$2 \quad VAR(P_j) = \sum_{i=1}^n \left[\frac{E_{ij}^2 * VAR(D_{ij})}{R_{ij}} \right] * A_{ij}^2$$

Where P_j , E_{ij} , R_{ij} , D_{ij} , and A_{ij} are the same as above.

Pressure estimates between waves and residency were assumed to be independent so variances were summed to obtain total variances. The square root of the variance was taken and this number was reported as the error for fishing pressure.

RESULTS

1993 ANNUAL

Licensed anglers fishing on Montana waters exerted 2,578,495 angler days of pressure for the 1993 license year. Residents accounted for 1,964,464 angler days (76.2%) and nonresidents made up the remaining 614,031 angler days (23.8%). Individual water estimates sorted alphabetically are given in a separate report "Montana Statewide Angling Pressure 1993".

The pressure distributed between Fish, Wildlife and Parks regions (Figure 1) emphasizes the cold water fishery (Chart 1). Region 3 received the most angling pressure with 729,739 angler days (28.3%). Regions 4 and 1 were next in order with 510,699 angler days (19.8%) and 400,332 (15.5%) angler days respectively. Region 2 had 387,952 angler days (15.0%) while region 5 had 328,982 angler days of use (12.9%). The warm water regions of 6 and 7 were the lowest in pressure with 118,676 (4.6%) and 85,358 (3.3%) angler days respectively.

Angling in Montana in 1993 was directed toward trout. Salmonid waters accounted for 88.6% (2,284,225 angler days) of the statewide pressure while nonsalmonid waters accounted for 7.9% (204,665 angler days) of the pressure and undesignated waters accounted for 3.5% (89,605 angler days) of the pressure (Chart 2). An undesignated water is one that did not have a unique code to assign, and therefore water type could not be determined. This water was assigned a generic code based on drainage and county so angling pressure could be estimated.

Within salmonid waters, the streams received more pressure than the lakes, 57.7% versus 42.3%. The nonsalmonid lakes received more pressure than the nonsalmonid streams, 58.9% versus 41.1% respectively.

Salmonid angling dominated the pressure in regions 1, 2, 3, 4, and 5. Regions 6 and 7 were predominately nonsalmonid angling (Chart 3, Table 4).

STATEWIDE PRESSURE ESTIMATES:							
		2578495.	67686.	1964464.	50419.	614031.	17267.

Region 3 had the largest angling pressure for salmonid streams (472,580 angler days) while region 4 had the largest angling pressure for salmonid lakes (278,370 angler days). Nonsalmonid stream fishing pressure was largest in region 7 (37,552 angler days), while the nonsalmonid lake angling pressure was largest in region 6 (52,204 angling days).

The majority of angling pressure in 1993 in all regions was exerted by residents (Chart 4). The percent of angling pressure by residents for each region was: region 1 - 76.1%, region 2 - 78.8%, region 3 - 63.2%, region 4 - 89.6%, region 5 - 76.8%, region 6 - 88.7%, and region 7 - 82.7%.

July (wave 5) was, overall, the peak fishing period, while November (wave 9) was the least fished period during the year (Table 5). Both residents and nonresident season license holders preferred to fish during July while residents fished the least in November and nonresident season license holders fished the least in March (wave 1).

The majority of the nonresident pressure (52.6%) was exerted by the 2-day license holders. Since these anglers were sampled once at the end of the license year the pressure could not be classified into waves although it can logically be assigned to the summer season.

12	80,538	73,955	6,583
99	263,259		263,259

Angling pressure was summarized by the 22 major drainages within the state (Table 6). The lower Clark Fork River drainage contains the angling pressure from all the streams and lakes below the Bitterroot River, excluding the pressure from those waters contained in other drainages listed (Flathead, Kootenai, and Bitterroot). The Upper Clark Fork River drainage, likewise, contains all the angling pressure for waters above the Bitterroot River drainage excluding the pressure for those drainages listed. The upper Flathead River drainage contains the South Fork Flathead River drainage and all waters above the confluence of the South Fork Flathead River. The lower Flathead River drainage includes those waters below the confluence of the South Fork Flathead River including Flathead Lake and those waters (where pressure was obtainable) on the Kootenai-Salish Indian reservation. The lower Missouri River drainage covers all waters below the confluence of the Marias River, while the upper Missouri River drainage incorporates the area above the Marias River, again excluding those drainages listed separately. The lower Yellowstone River drainage represents the area below the mouth of the Bighorn River while the upper Yellowstone River drainage covers the Bighorn River drainage and all waters above the confluence of the Bighorn River.

The pressure by drainage ranged from 449,057 angler days for the Upper Missouri River drainage to 634 angler days for the Little Missouri River drainage.

Table 6. - Angling pressure in angler days by drainage by water type for the 1993 angling year

1993 SUMMER

The "summer" season for angling in Montana is considered as that period of the year between the first of May through the end of September. In 1991 1,962,554 (76.1%) days of angling pressure occurred during this period (Table 7). Percentages of angling pressure within the regions for the summer period was very similar to the entire year ranging from 73.9% for region 4 to 82.7% for region 7.

Residents accounted for 72.0% of the "summer" angling pressure (1,412,362 angling days). Within the regions the residents comprised anywhere from as high as 87.3% of the "summer" angling pressure in region 6 to as low as 57.6% of the pressure in region 3.

Table 7. - Angling pressure in angler days by region by water type for the "summer" season of May 1993 through September 1993.

		1962554.	56244.	1412362.	40072.	550192.	16172.

"Summer" angling pressure by drainage (Table 8) ranged from 327,297 angler days for the upper Missouri River drainage to 608 angler days for the Little Missouri River drainage.

Angling pressure for residents by drainage ranged from a low of 33.4% for the Madison River drainage to a high of 95.0% for the Musselshell drainage.

1993 WINTER

The "winter" season for angling is from March through April and October through February of the following year. In 1993, 615,893 angler days (23.9%) of the annual fishing pressure occurred during this period (Table 9). Residents accounted for 89.6% of the total angling pressure for the "winter" season. Angling pressure was directed towards salmonid streams with 47.1% of the "winter" use. Salmonid lakes accounted for 41.9% of the use during this same time period.

The pressure from region to region ranged from a high of 181,070 angler days for Region 3 to a low of 14,801 angler days for Region 7. Angling pressure by residents for this period for each FWP region ranged from a low of 88.8% for region 7 to a high of 97.1% for region 4.

Winter angling pressure (Table 10) by drainage ranged from 121,762 angler days for the Upper Missouri River drainage to 26 angler days for the Little Missouri River drainage in Eastern Montana. Residents accounted for as low as 57.1% of the pressure in the Madison River

drainage to a high of 100% of the pressure in the Little Missouri River, Musselshell, St. Mary River, upper Flathead River, and Sun River drainages.

Table 9. - Angling pressure in angler days by region by water type for the "winter" season of March 1993 through April 1993 and October 1993 through February 1994.

DISCUSSION

SCOPE OF ANGLING PRESSURE

The statewide angling pressure survey was conducted from March, 1993 through February, 1994. Estimates of pressure by residents and nonresidents were for licensed anglers only. This would encompass anglers 12 years of age and older. Spence (1971) found that the unlicensed angler (ages 2- 14) comprised 9% of the pressure on Rock Creek near Missoula. Peterson (1970) found that the unlicensed angler accounted for 21% and 19% of the total number of anglers on Big Spring Creek near Lewistown during 1968 and 1969 respectively. On the Bighorn River near Hardin, Stevenson (1975) found that the unlicensed angler accounted for 14.2% and 15.8% of the total number of anglers during 1972 and 1973 respectively. Fredenberg (1984) found that 10% of the anglers on Bighorn Lake and 13% of the anglers on the Yellowtail Afterbay were unlicensed. The 1975 National Fishing and Hunting Survey showed that 23.8% of the anglers nationwide were between the ages of 9 and 17. It appears that the unlicensed angler makes up between 9% to 21% of the fishing pressure depending on the type of water being fished.

Some angling pressure was obtained on Indian reservations and National Parks within Montana. This pressure was incidental to other fishing trips and only included those anglers that had purchased a Montana fishing license. Since national parks and reservations require different licensing, a complete pressure estimate of waters within those regions was not obtained.

ACCURACY

SAMPLING

Samples were drawn and questionnaires sent to the selected anglers as soon as possible. This was usually 15-20 days after the wave being sampled had ended (see discussion under Methods for details). Since license dealers are not required to remit copies of licenses sold until the 10th of the following month, the samples may not contain all the eligible anglers for a given period. The months of April through September are most affected by this procedure, since license sales naturally curtail after September. This means of obtaining a sample may skew the pressure if license dealers from a given area don't remit their licenses in a timely manner. At the present time, there is no way to estimate the extent, if any, of this bias.

PRESSURE

No significant difference was found between the survey results and on-site creel census for rivers for the statewide angling mail surveys conducted from 1982 through 1985 (McFarland, 1989). When both surveys were conducted simultaneously on lakes and reservoirs, the results again agreed (McFarland, 1989). The same methodology was used in this survey as was used in those conducted from 1982 through 1985 and in 1989 (McFarland, 1991). At the time this report was written, no published results were available for creel census conducted during the same time frame so no direct comparisons could be made.

RETURN RATES

Return rates (# of respondents / [# of surveys sent - nondeliverables] * 100) were calculated for every wave by residency. Return rates were calculated with and without the follow-up phone calls of resident nonrespondents (Table 11). The average total return rates for residents and nonresidents was 65.8% and 68.7% respectively. Nonresident return rates for season license holders was 69.4% and was less for 2-day license buyers at 60.4%. Without the telephone calls of nonrespondents the average return rate dropped to 62.3% for residents and 57.7% for 2-day nonresident license holders. No phone calls were made to nonresident season license holders so the return rate remained the same.

Table 11. - Return rates by residency with and without phone follow-ups for the 1993 statewide angling survey.

WAVE	Total Return Rates		Return Rates w/o Phone	
	Resident	Nonresident	Resident	Nonresident*
1	86.3	68.0	64.4	68.0
2	63.8	66.5	62.2	66.5
3	61.6	62.7	60.2	62.7
4	61.5	69.3	60.1	69.3
5	58.7	70.0	57.2	70.0
6	61.7	69.0	60.1	69.0
7	60.2	65.5	58.6	65.5
8	61.8	72.6	60.2	72.6
9	67.5	71.2	64.6	71.2
10	69.9	72.5	67.5	72.5
11	68.9	74.7	67.2	74.7
12	67.9	70.4	65.3	70.4
99		60.4		57.7

* Nonresident season license nonrespondents were not telephoned.

NONRESPONSE BIAS

Telephone calls were made to a random sample of nonrespondents to ascertain if the percent fishing was different from those who responded to the mail survey. The average phone respondent was no more likely to have fished than than mail respondents (paired t-value= 0.75, 11 d.f. p-value = .47). The range, from wave to wave, was 1.5 times for January to .15 times as likely to fish for February. February was the only month that was high (6.5 times more likely to fish for phone respondents). For the months of March, April, May, December and January, the mail respondents were more likely to go fishing than the phone respondents. During the other months the reverse was true.

NUMBER OF LICENSED ANGLERS VS PRESSURE

The number of resident anglers has increased for the period 1982 to 1985 and then decreased until 1989 and then continued to steadily increase (Table 12). The number of nonresident anglers during this same period decreased initially and then increased so that overall, the

total number of anglers remained fairly static until 1993. In 1993 there was a 6.1% increase from the previous year in the total number of licensed anglers in Montana. The number of nonresident licensed anglers increased by 12.7% while the resident licensed angler increase was lower at 2.2%.

Table 12. - Number of licensed anglers from 1982 through 1993 by residency.

Year	Resident Anglers	Nonresident Anglers
1982	216,689	119,293
1983	217,483	116,875
1984	232,485	102,843
1985	236,455	106,304
1986	235,403	100,456
1987	233,111	103,936
1988	219,299	108,471
1989	216,412	114,254
1990	217,370	119,611
1991	221,723	138,243
1992	222,186	134,212
1993	226,992	151,192

Comparing statewide angling use from the mail survey versus number of anglers shows some correlation for residents in the recent years (1989-1993), while nonresidents seem to have some association between number of anglers and the amount of use exerted (Charts 5 & 6) with the exception of 1991. In 1991 the number of nonresident anglers increased while the pressure exerted by nonresidents decreased.

Resident Anglers vs Pressure

-- Anglers + Pressure

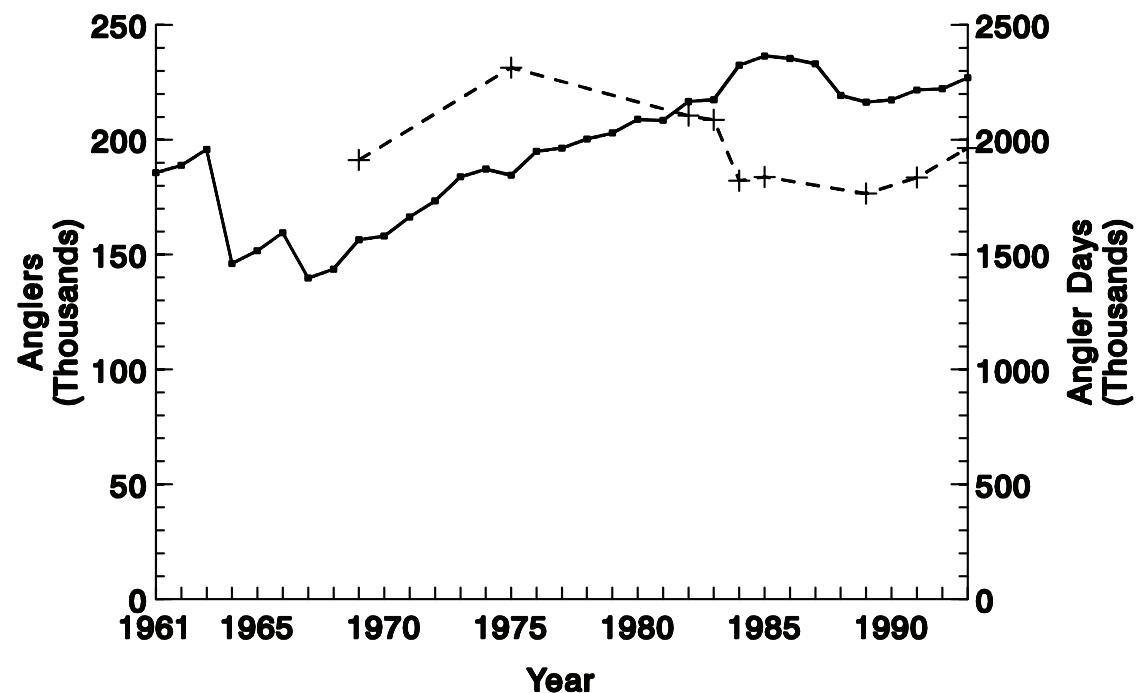

Chart5. - Angling pressure versus number of anglers for residents from 1961 to 1993.

Nonresident Anglers vs Pressure

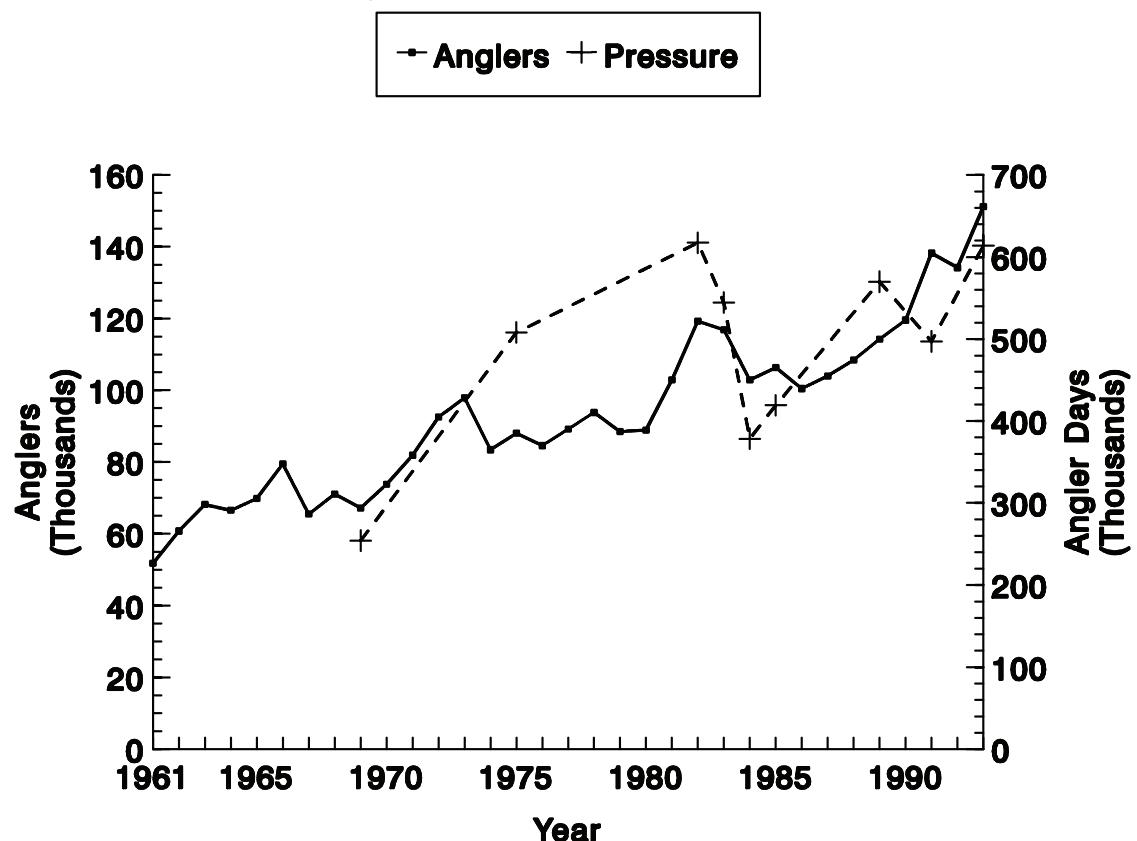

Chart 6. - Angling pressure versus number of anglers for nonresidents from 1961 to 1993.

CONCLUSIONS AND RECOMMENDATIONS

The statewide angling pressure mail survey continues to provide invaluable data on individual bodies of water as well as statewide estimates.

Nonresident big game license holders need to be sampled to see if the rate of fishing has changed within this segment of the angling public.

It is recommended that the survey continue to be conducted every other year. This will provide long-term trend data.

Dear Angler,

We are conducting a monthly survey sent to a random sample of fishing license holders. This survey provides important data to help determine fishing pressure on the lakes and streams of Montana. By providing us with this vital information, you will be assisting us in properly managing Montana's fish population.

This survey requests only YOUR fishing activities. Include ALL waters fished during the month of MARCH, 1993. If you fished one of the streams on the back of this form, please include the section number to aid us in identifying the portion of the stream. All information you provide will be held in strict confidence. We appreciate your continued cooperation in returning this survey at your earliest convenience.

EVEN IF YOU DID NOT FISH OR CATCH ANY FISH, PLEASE FILL OUT AND RETURN THIS QUESTIONNAIRE.

Did you fish in Montana during the month of MARCH, 1993?

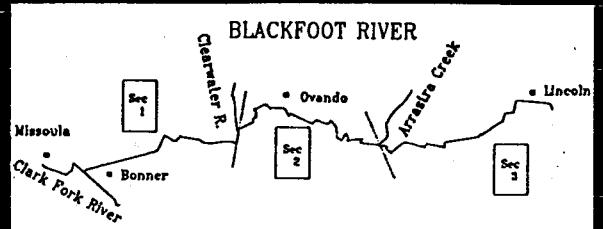

Yes - If yes, total number of days fished _____?
Please continue below.

No - If no, stop here and return form.

ENTER EACH WATER FISHED ON A SEPARATE LINE. (Your fishing only)

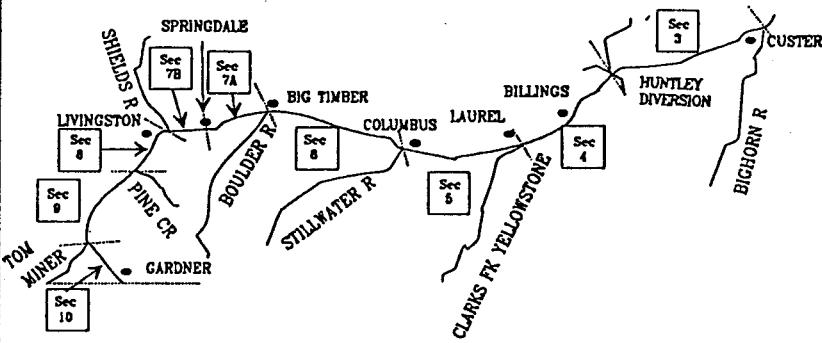

Thank you for your assistance.

WE NEED INFORMATION ON ALL WATERS FISHED IN MONTANA NOT JUST THE WATERS INCLUDED ON THIS PAGE.
SPECIFIC SECTIONS OF MONTANA WATERS THAT ARE DIFFICULT TO IDENTIFY

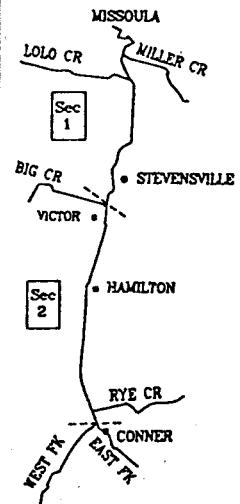

We need information on ALL waters fished in Montana not just the waters included on this page. If you fished one of the rivers indicated on a map, please enter the specific section number in the appropriate space on the questionnaire form. For waters other than those indicated on a map, this includes the Flathead, Milk River, eastern sections of the Missouri and Yellowstone, etc., please be very specific as to the name of the lake, stream, or reservoir and the nearest town, point of access, or landmark to facilitate identification.
